

GAME COUNTS IN NORTH-WEST NAMIBIA

Palmwag and Etendeka

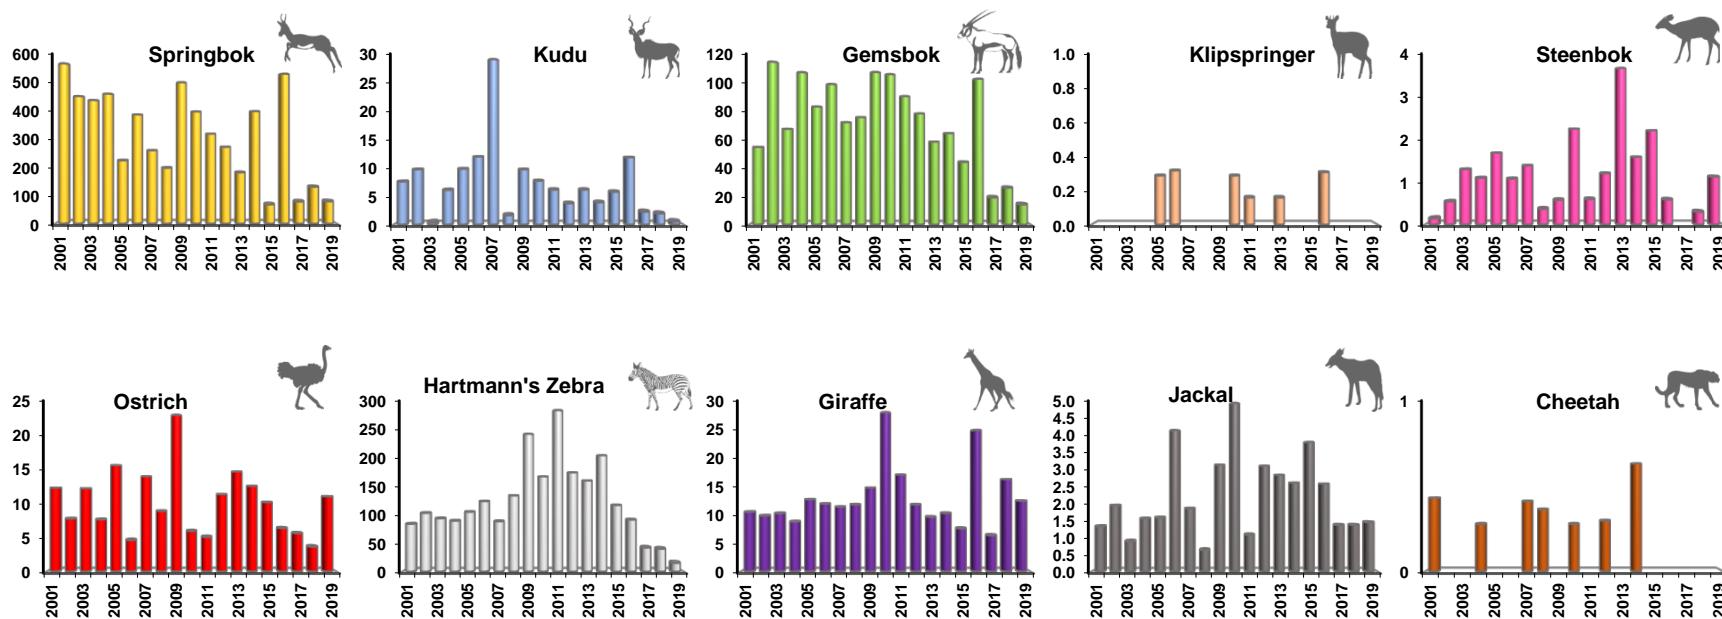

May 2019

Total Population Estimates

Species	Population estimate	Lower 95% CL	Upper 95% CL
Gemsbok (U)	865	530	1,410
Kudu (HN)	180	55	570
Ostrich (U)	380	150	980
Springbok (HN)	7,650	3,470	16,900
Steenbok (HN)	480	170	1,350
Hartmann's Zebra (HN)	1,010	280	3,620

All above estimates are derived using DISTANCE analysis. This takes account of drop off in detection with distance from the transect line. They are conservative estimates as 43% of the count area is not sampled (due to inaccessibility) and is consequently assumed to hold no animals. Model selection: U = uniform key; HN = half normal

Trends- Number of animals per 100km

Animals seen during this count and minimum estimates

	Total	Etendeka	Palmwag
Total Route km	684	135	549
Total area (km ²)	6,524	633	5,891
Number of routes	14	3	11
% area excluded	87	44	43

Values without brackets are numbers of animals seen along transects. Values inside brackets are minimum estimates assuming all animals within 500m on each side of the transect line are detected i.e. there is no adjustment for drop off in detection with distance from the transect line. In addition, for springbok, gemsbok and giraffe, large groups were excluded from extrapolations and added afterwards.

The sum of these values will be significantly lower than the totals indicated in the top left table as the total estimates take account of species detection curves.

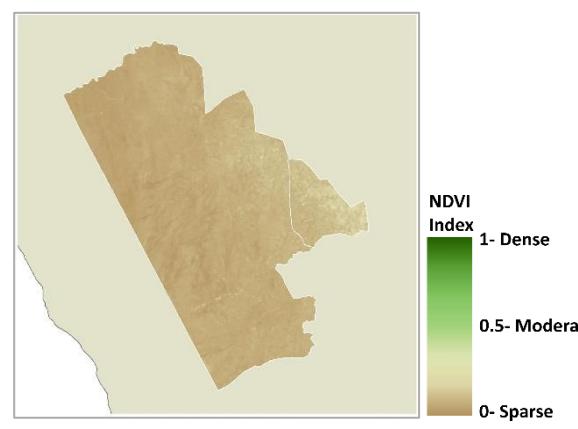

Rainfall

The rainfall season is from July to June and values are an average for the whole area. The year represents the season immediately prior to the count.

Vegetation

NDVI is a measure of the density of chlorophyll in vegetation cover. It can be used as an indicator of the amount of biomass available to wildlife. The map shows the NDVI status in the current year (Mar-May) and the trend indicates the average deviation from the long-term mean (2001-2018).
